

AI Order Priority & Notification System

(n8n + AI Workflow Blueprint)

Overview

This workflow automates the process of handling e-commerce orders using AI.

It captures incoming orders, analyzes them using an AI agent, assigns priority (High / Medium / Low), sends email notifications, and logs all data into Google Sheets.

Objective

- Eliminate manual order handling
 - Automatically prioritize orders
 - Ensure urgent orders are handled first
 - Maintain a structured log of all orders
-

Key Features

-  AI-based order prioritization
 -  Automated email notifications
 -  Real-time logging in Google Sheets
 -  Fully automated workflow
 -  Easy to customize and extend
-

Workflow Architecture

```
Webhook Trigger
↓
Set (Normalize Order Data)
↓
AI Agent (Priority Classification)
↓
Set (Parse AI Output)
↓
Switch (Route by Priority)
├─ High → Email → Google Sheets
├─ Medium → Email → Google Sheets
└─ Low → Email → Google Sheets
```

Input Format

The workflow expects incoming order data in the following format:

```
{
  "order_id": "ORD123",
  "customer_name": "John",
  "email": "john@example.com",
  "order_value": 12000,
  "delivery_type": "express"
}
```

AI Decision Logic

The AI agent classifies order priority using the following rules:

1. If `delivery_type = "express"` → **High Priority**
2. Else if `order_value > 10000` → **High Priority**
3. Else if `order_value between 3000-10000` → **Medium Priority**
4. Else → **Low Priority**

Notification System

High Priority

- Immediate email alert
- Requires urgent attention

Medium Priority

- Standard notification
- Process in normal workflow

Low Priority

- Informational alert
- Can be handled later

Data Logging (Google Sheets)

Each processed order is stored with:

- Order ID
- Customer Name
- Email

- Order Value
 - Delivery Type
 - Priority
 - Timestamp
-

Tech Stack

- **n8n** → Workflow automation
 - **OpenAI API** → AI classification
 - **Gmail** → Email notifications
 - **Google Sheets** → Data storage
-

Setup Guide

Step 1: Import Workflow

- Import the workflow JSON into n8n

Step 2: Configure Credentials

- Add OpenAI API key
- Connect Gmail account
- Connect Google Sheets

Step 3: Activate Webhook

- Copy webhook URL
- Use it as order input endpoint

Step 4: Test Workflow

- Send sample order data
 - Verify:
 - Priority classification
 - Email notifications
 - Google Sheets entry
-

Testing Scenarios

Case	Input	Expected Output
High (value)	₹12000	High
High (express)	express delivery	High
Medium	₹5000	Medium
Low	₹1000	Low

Use Cases

- E-commerce stores
- Dropshipping operations
- Order management systems
- Business automation workflows

Future Enhancements (Phase-2)

- AI reasoning (why priority was assigned)
- SLA tracking (processing time)
- VIP customer detection
- Confidence scoring
- Analytics dashboard

Benefits

- Saves time 
- Reduces manual work 
- Improves response time 
- Ensures critical orders are prioritized
